PLUGIN ACTIVATION GUIDE

This is a full step-by-step guide on how to activate any THR plugin.

In case the activation does not succeed, I have added a few extra steps on how to solve this.

Important: An active internet connection is required to activate and run the plugin if you want to be able to control the activations (disabling one to activate on a different computer).

Offline licenses are bound to one computer and can't be deactivated.

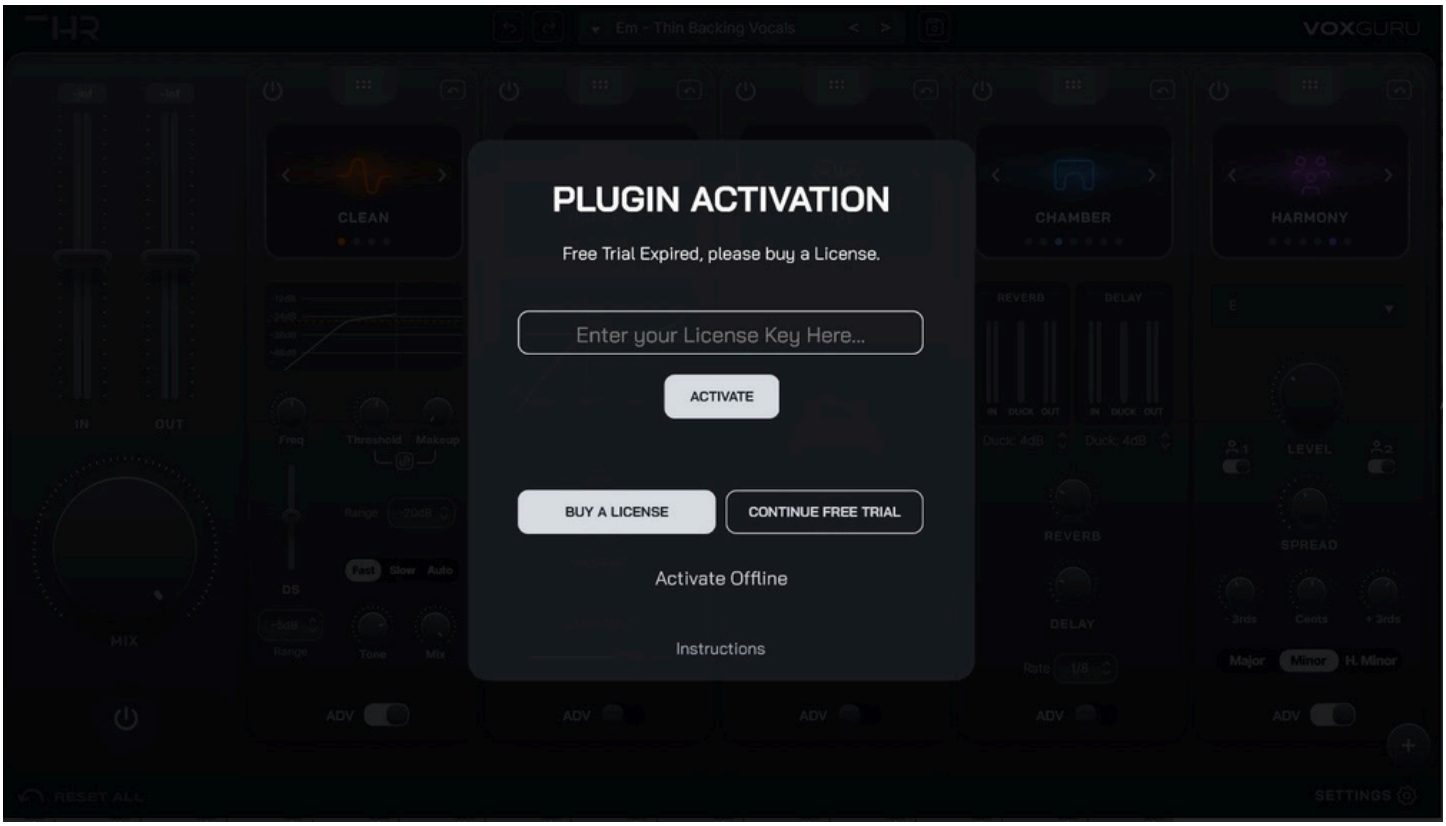

After purchase, you will receive an email in your inbox with the license keys or you can find them in the "Licenses" section in your account.

Activation Steps

1. Open the plugin in your DAW

Click on a free insert slot and add the plugin by searching for “THR”.

2. Enter the Serial Number

You should have received your serial number via email from “Sealbucket” (check your spam folder just in case) and you can also find it in your account after purchasing.

It is a 20-digit code in this format: **xxxx-xxxx-xxxx-xxxx-xxxx.**

Copy and paste this serial code into the plugin and click on “Activate”.

The plugin should now have been activated successfully.

“Invalid License” error Fix

If clicking on the activate button shows a message similar to “Invalid license or no internet connection” then the problem is that the **plugin is not able to reach the licensing server to validate the serial key.**

In this case, you have two options:

1. Activate on a different DAW

Sometimes activating the plugin on a different DAW solves the issue.

Once the plugin is active, it will work on any DAW.

This problem is most common in Logic Pro and Studio One for some reason.

1. Create an Offline Activation License

Offline activation licenses are designed to let you use the plugin without an internet connection, which solves the error mentioned above (See next page).

Offline Activation

Important: Offline licenses are bound to one computer and can't be deactivated.

These licenses are used to activate plugins on machines that have no internet access.

To create the license, you will need to use another computer that has internet access (If the license is going to be used on a machine with internet access, then you don't need another machine).

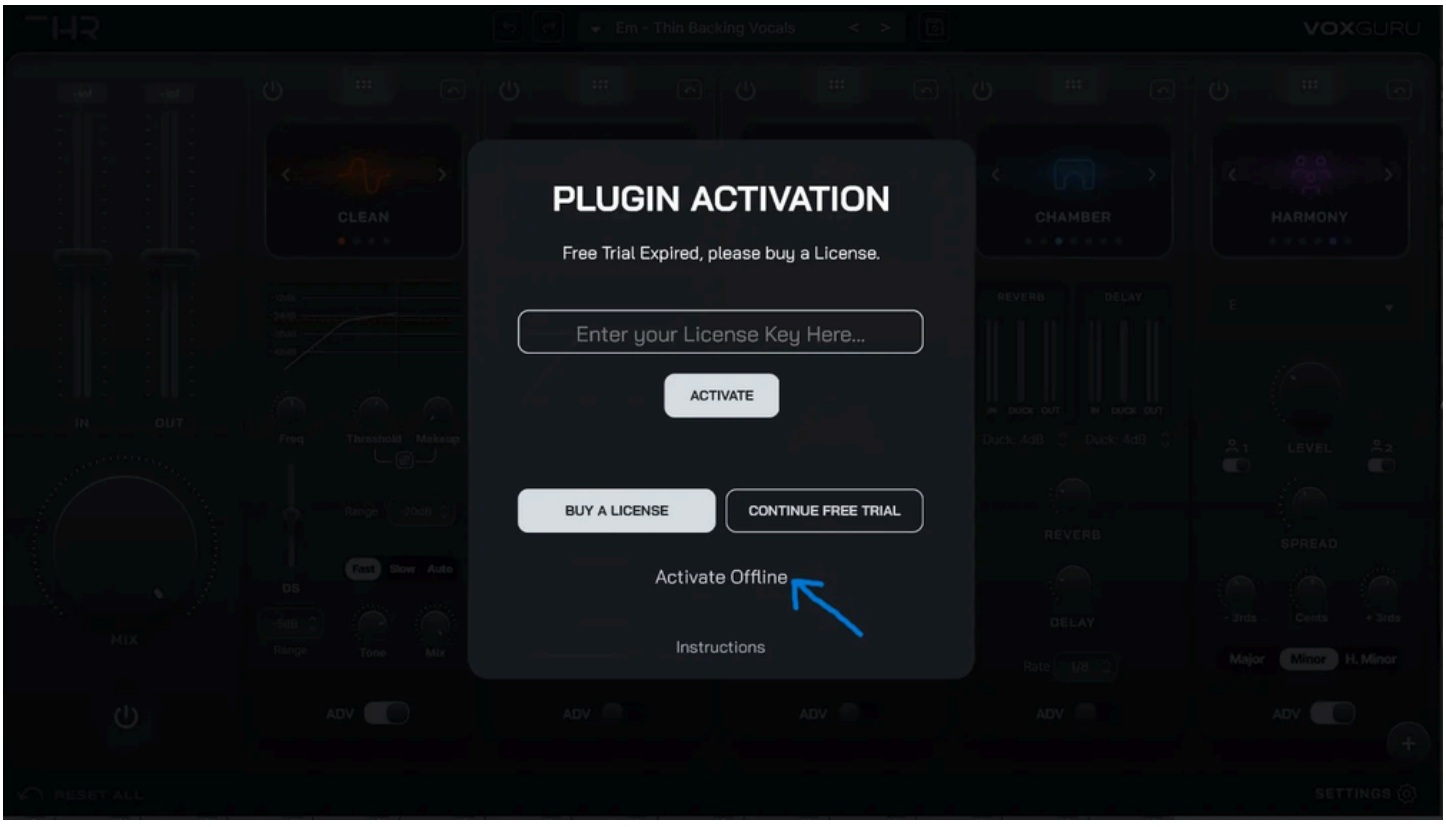

The license file created there can then be used on the offline machine.

Important: Steps 3 and 4 are only required to transfer the Host ID from an offline machine to a computer with internet access. **If the machine already has internet access, these steps can be skipped.**

Steps to generate a License File:

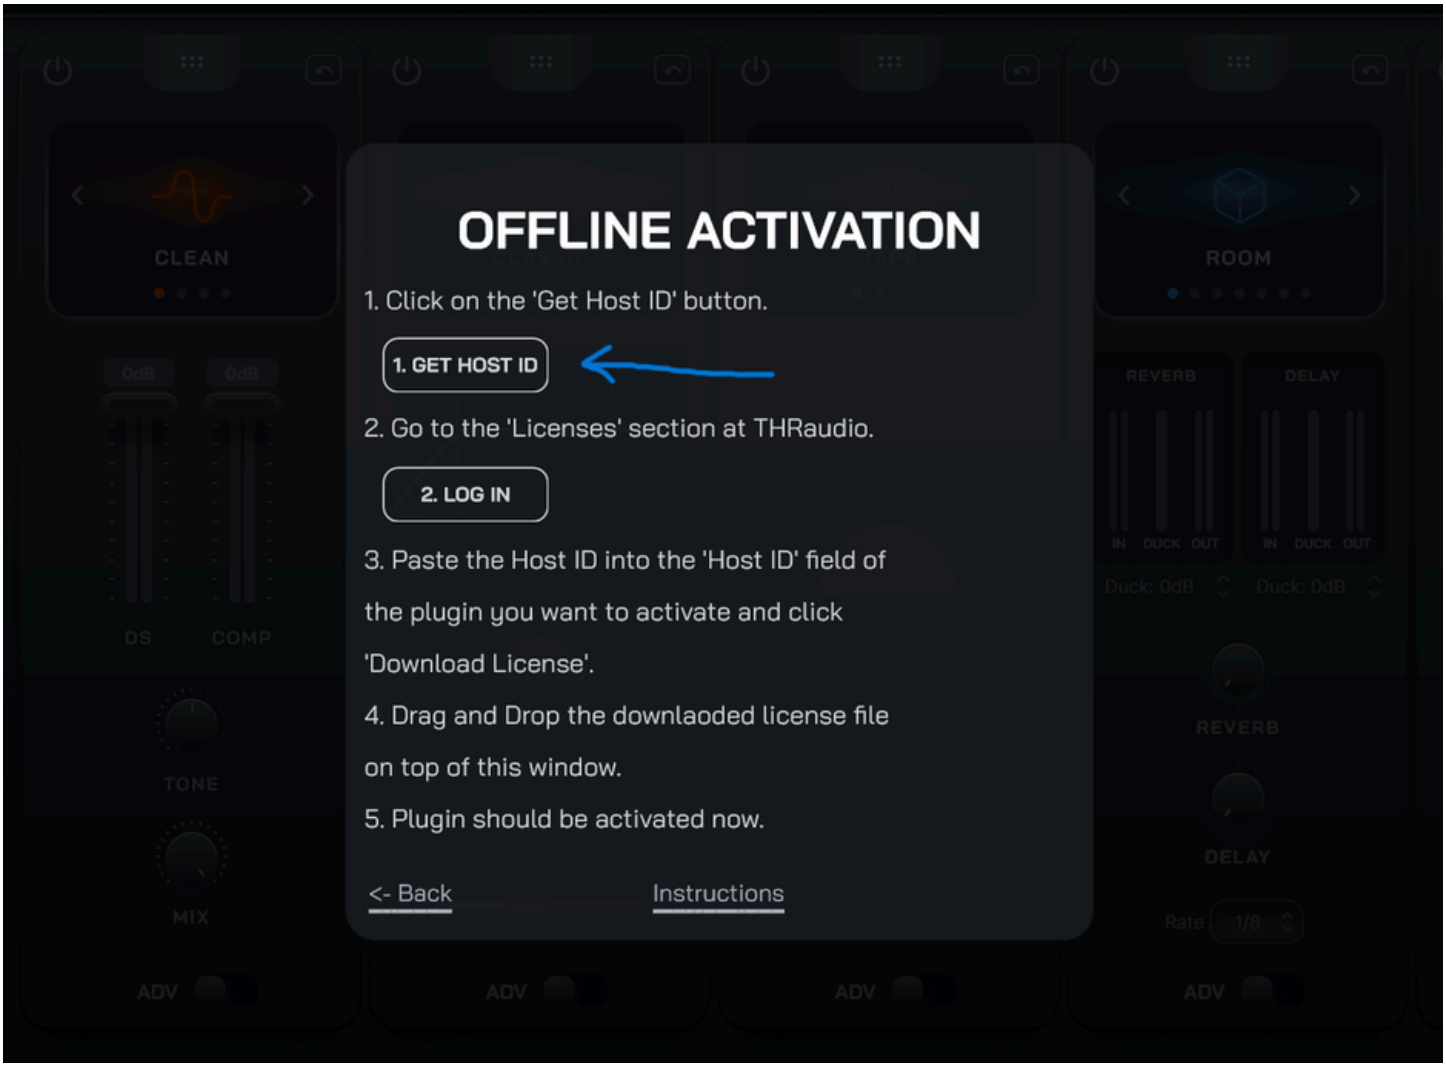

First head over to: https://thraudio.com/pages/offline-licenses. You will be required to log in.

1. Open the plugin on the machine where it will be used and **click Activate Offline**.

2. Click the **Get Host ID button**.

This automatically copies the machine's unique Host ID.

3. Paste the Host ID into a text file, save it, and copy the file to a USB or thumb drive (This step is only for moving the Host ID to another computer).

4. Insert the USB or thumb drive into a computer with internet access, open the text file, and copy the Host ID (This step is only for transferring the ID).

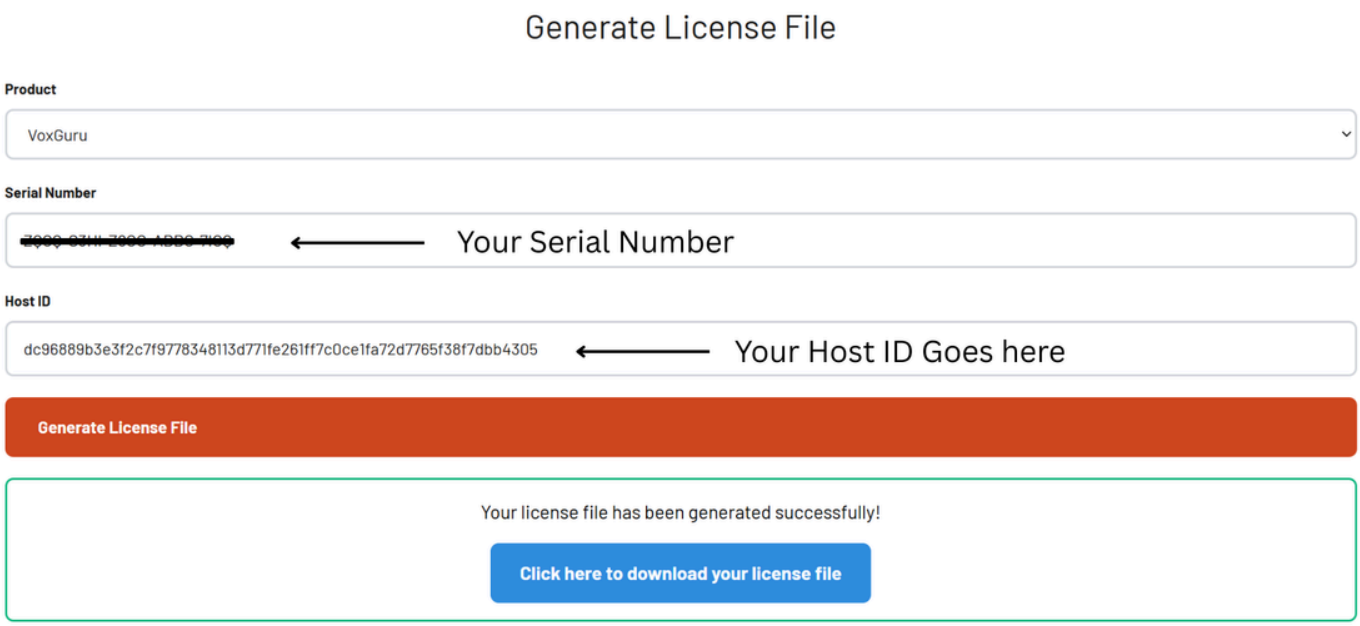

For this next part you need to head over to the offline generation page at thraudio.com https://thraudio.com/pages/offline-licenses.

You will be required to log in.

5. **Select the product.**

6. **Enter your serial number** (a 20-digit code in this format: **xxxx-xxxx-xxxx-xxxx-xxxx**).

7. **Paste the Host ID into the Host ID field.**.

8. Click **Generate License**.

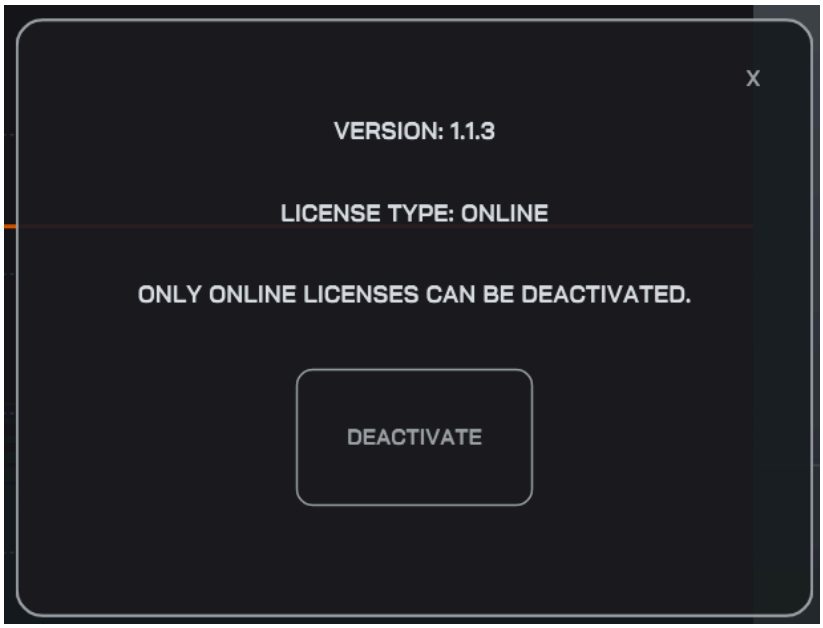

9. **Download the license file** and transfer it back to the offline machine to complete activation.

10. **Copy the license file over to the offline computer and drag the file on top of the plugin**.

Deactivation Steps

If you already used the 3 activations every plugin allows you to, you can manually deactivate one to free up a new activation to use on a different machine.

To do this, **click on “THR” logo** and then click on the “Deactivate” button on the window that pops up.

Important: This only works for licenses that were activated using the serial (Online activations).

Offline activations are machine bound and can never be deactivated.
